HyperCore System Limits

This paper lists hard limits used during sizing.

Limits apply per cluster, per virtual machine, and per replication job.

Table 1. Cluster limits

Nodes per cluster: 8

Virtual machines per cluster: 200

Snapshots per virtual machine: 32

Concurrent replications: 4

Per-VM limits

A virtual machine supports up to 32 vCPUs and 512 GB of memory.

A virtual machine supports up to 16 virtual disks.

Import and export jobs are limited to 2 concurrent operations per node.

Replication limits

Replication requires matching HyperCore versions on source and target.

A single virtual machine can have one active replication target.

Scheduled snapshots used by replication count toward the 32 snapshot limit.
