Mixed Operations Notes / ملاحظات تشغيل مختلطة

User management / إدارة المستخدمين

This document explains HyperCore operations in Arabic and English.
An administrator signs in and reviews node and storage status.
The administrator can create a user and assign a role.
Roles control permissions such as creating virtual machines or deleting snapshots.

Virtual machines / الآلات الافتراضية

To create a virtual machine, choose CPU, memory, and disk.
An ISO can be mounted at creation or later from device settings.
A snapshot saves the machine state and can be restored later.

Support / الدعم

When a disk or node fails, collect logs before opening a support ticket.
Include the node number, failure time, and software version.
