SC//HyperCore Operations Guide

Chapter 1. Setup

This guide covers day-to-day operation of SC//HyperCore for cluster administrators.
Prerequisites include a supported browser, network access to the cluster, and an administrator
Registration can be completed with or without an internet connection.
Single Sign-On supports Active Directory, Okta, and custom SSL certificates.
The web interface is organized into panels for monitoring nodes, virtual machines, and storage

Chapter 2. Users

Access is controlled through individual user accounts and role-based permissions.
Administrators can create, edit, and delete users, and can reset passwords.
Roles define which panels and actions a user can reach.

Chapter 3. Virtual Machines

Administrators create virtual machines by choosing CPU, memory, disks, and an optional ISO.
A virtual machine can be edited, cloned, imported, or exported.
Snapshots capture a virtual machine state and can be restored later.
vTPM support is available for guests that require a virtual trusted platform module.

Chapter 4. Support

For a node or disk failure, follow the hardware replacement procedure before opening a suppor
Include cluster logs, the affected node serial number, and the time of the failure.
System limits are listed in the appendix, including per-cluster and per-VM maximums.
